

# Introduction to Software Engineering

---

## Software lifecycle lecture

Philippe Lalanda

[Philippe.lalanda@imag.fr](mailto:Philippe.lalanda@imag.fr)

<http://membres-liglab.imag.fr/lalanda/>

# Outline

---

- ❑ Introduction
- ❑ Waterfall model
- ❑ Evolutionary development
- ❑ Agile approaches
- ❑ Conclusion

# Software activities (1)

---

- ❑ Recurrent activities
  - ❑ Requirements
  - ❑ Design
  - ❑ Implementation
  - ❑ Deployment
  - ❑ Operation and maintenance
  
- ❑ Activities produce various artifacts (documents, code, ...) that must be evaluated

# Software activities (2)

---

- ❑ Transverse activities
  - ❑ Project management
  - ❑ Quality management
  - ❑ Document management
  - ❑ Externalization management
  - ❑ Purchase management
  - ❑ ...
  
- ❑ Not in the scope of this course

# Linking all together

---

- ❑ Activities do not follow one another nicely.  
This is due to
  - ❑ unclear scope
  - ❑ Instability
    - ❑ inability to finish / validate activities
  - ❑ Dynamicity
    - ❑ new requirements
    - ❑ New conditions (market, available tools or COTS, ...)
    - ❑ → need to backtrack

# Software processes (1)

---

- ❑ A software process is a set of activities
  - ❑ An activity is a set of tasks, resources, constraints and ways to be performed
  - ❑ Activities are the same formost processes
- ❑ A software process defines how activities are linked together
  - ❑ Many processes have been defined; some are generic and some are specific to organizations

# Software processes (2)

---

- ❑ Software processes are intellectual and creative processes
  - ❑ Rely on people
  - ❑ Attempts to automate processes have had limited success
- ❑ Also, big diversity of software processes
  - ❑ No ideal process
  - ❑ Must conform to available people, target domain ...
  - ❑ Critical systems require very structured processes, business systems require flexible processes

# Software process models

---

- ❑ A software process model is an abstract representation of a software process
  - ❑ Process frameworks that can be extended, tailored to specific SE processes
  
- ❑ Major process models
  - ❑ Waterfall model
  - ❑ Evolutionary development
  - ❑ Agile approaches

# Outline

---

- ❑ Introduction
- ❑ Waterfall model
- ❑ Evolutionary development
- ❑ Agile approaches
- ❑ Conclusion

# Waterfall model

---

- ❑ Development is seen as a succession of steps, strictly sequential
- ❑ Each step is a base activity
- ❑ Each step is validated
- ❑ There is no (or little) backtrack

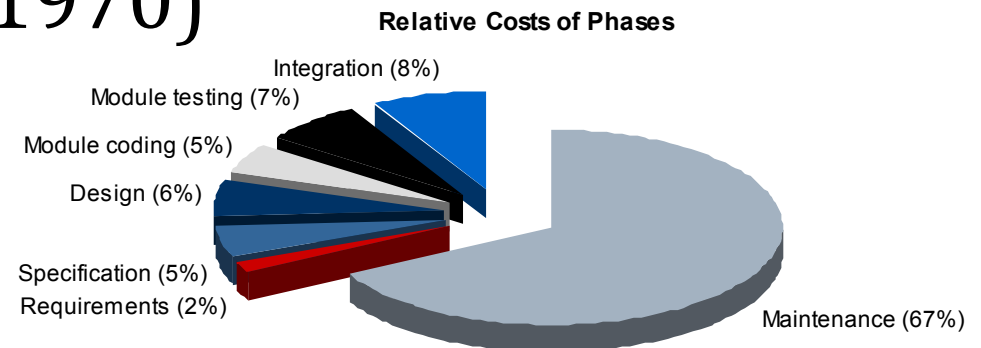

# Code and fix

- ❑ We code first, then, we modify
  - ❑ Wild development
  - ❑ Little analysis, lot of coding
  - ❑ Your last student project ?

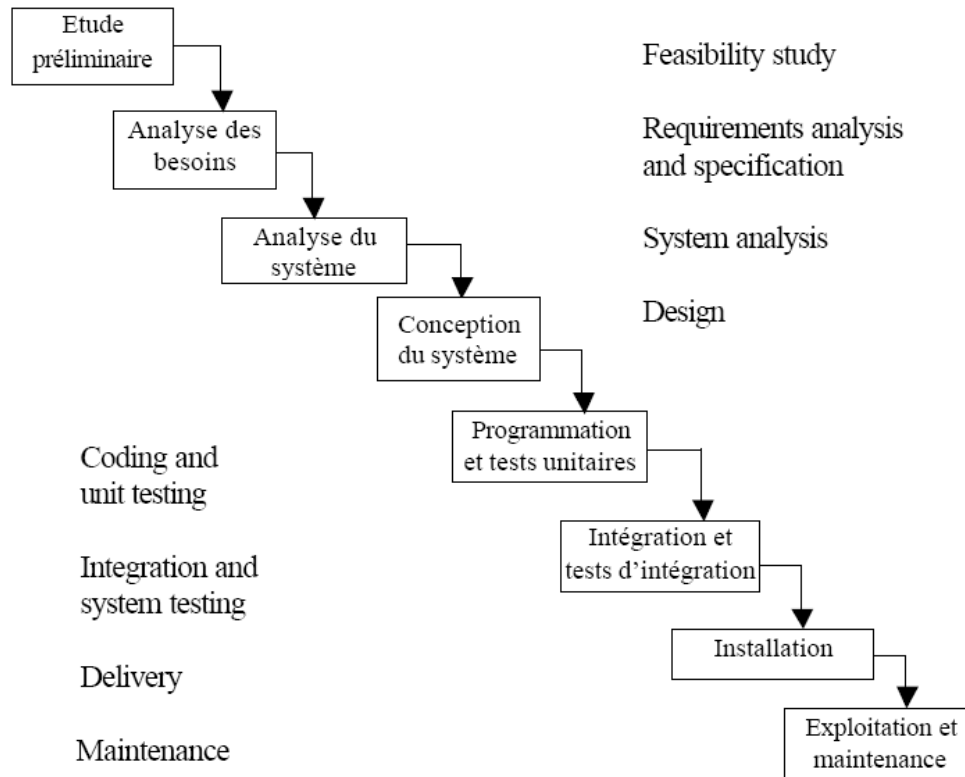

- ❑ Primitive model (< 1970)
  - ❑ Not adapted to large, multi team developments

# Waterfall model (1970)

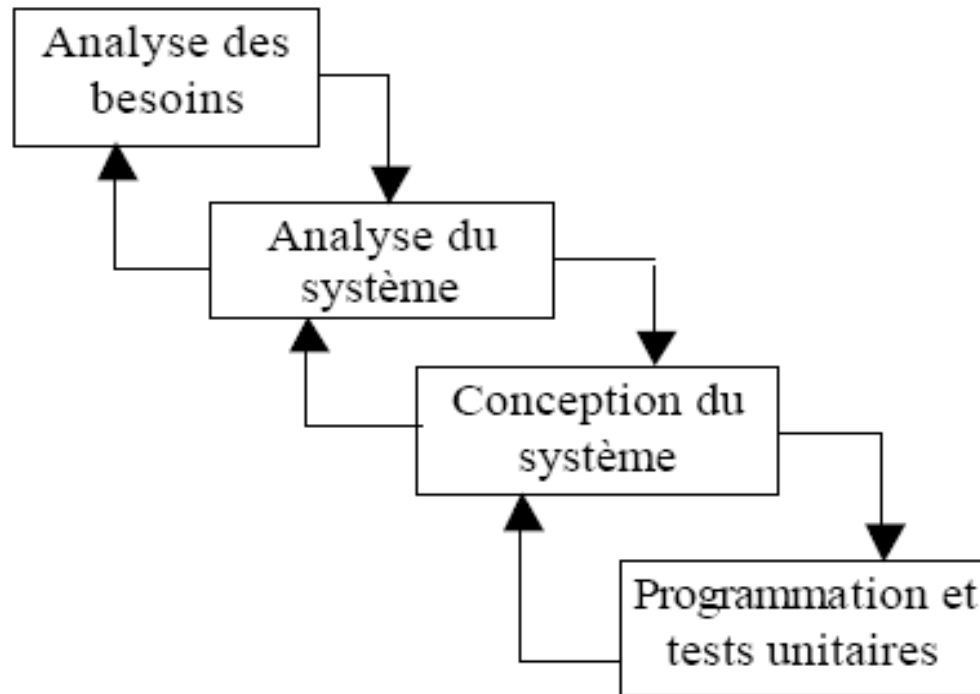

---

- ❑ Large set of activities
- ❑ Document-oriented
- ❑ No backtrack
- ❑ Classic engineering

# Waterfall model with iterations

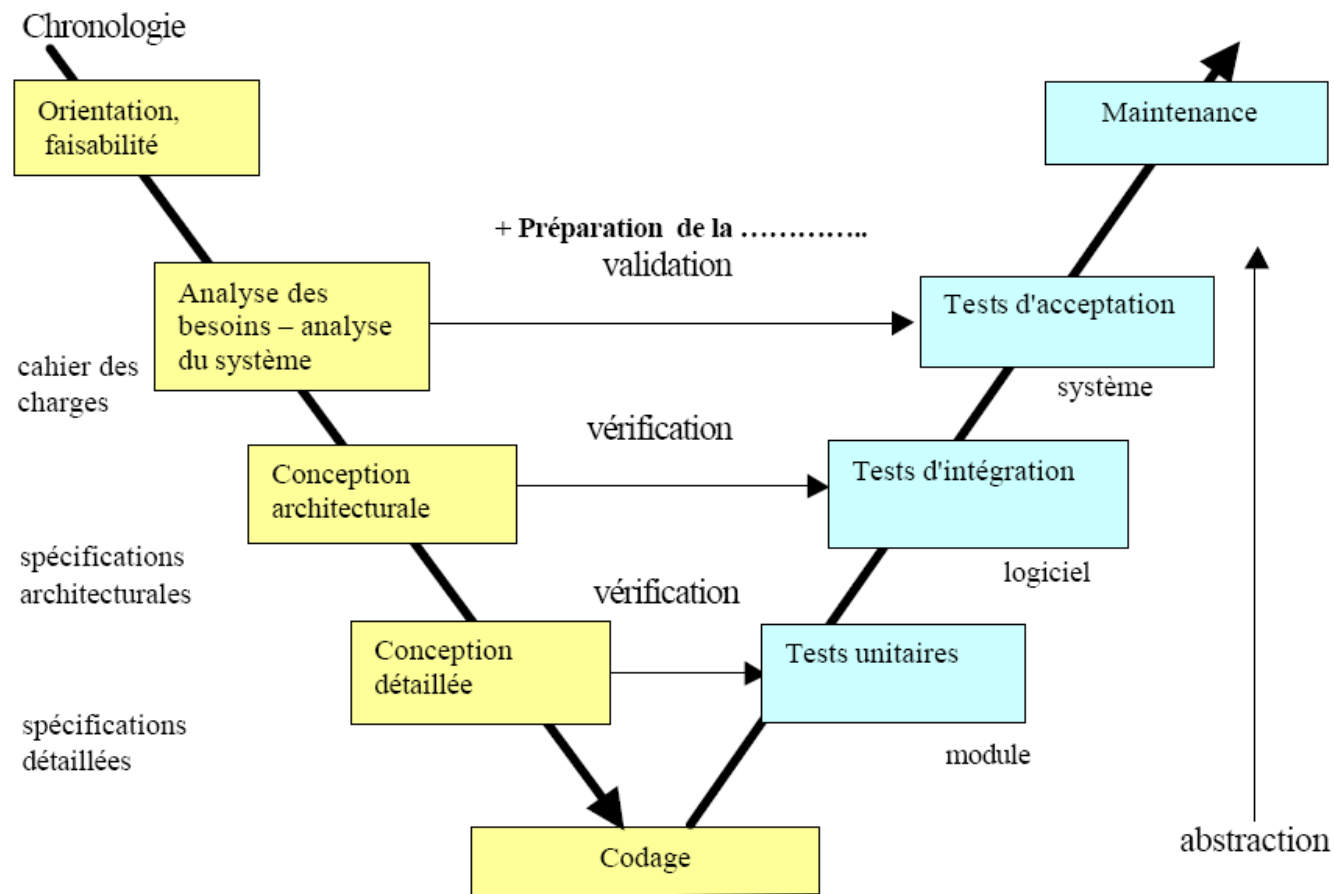

---

- ❑ Possible backtrack
- ❑ More flexible
- ❑ Still hard to manage
- ❑ Limited number of iterations

# V process

## ❑ Tests are defined at every phase

# Advantages of waterfall models

---

- ❑ Simple, easy to grasp
- ❑ Enforce documentation
  - ❑ A step is not completed till document validation
- ❑ Test is included in every step (V)
- ❑ Progress is tangible
  - ❑ For the development team
  - ❑ For the managers, too !

# Limits of waterfall models

---

- ❑ Document-driven
  - ❑ Meaningless to clients and users
  - ❑ Final product is the first artifact seen by users
- ❑ Makes the hypothesis the project is feasible
  - ❑ Solvable problem
  - ❑ Many problems are discovered at the end
- ❑ Not flexible
  - ❑ Stable needs, does not deal with evolutions
- ❑ Not realistic in most cases

# Conclusion about waterfall models

---

- ❑ Applicability
  - ❑ Known and stable needs
  - ❑ Solid technologies
- ❑ Still very popular
  - ❑ Simple and similar to other engineering domains
  - ❑ Often used by non specialists or inexperienced software engineers

# Outline

---

- ❑ Introduction
- ❑ Waterfall model
- ❑ Evolutionary development
- ❑ Agile approaches
- ❑ Conclusion

# Changes

---

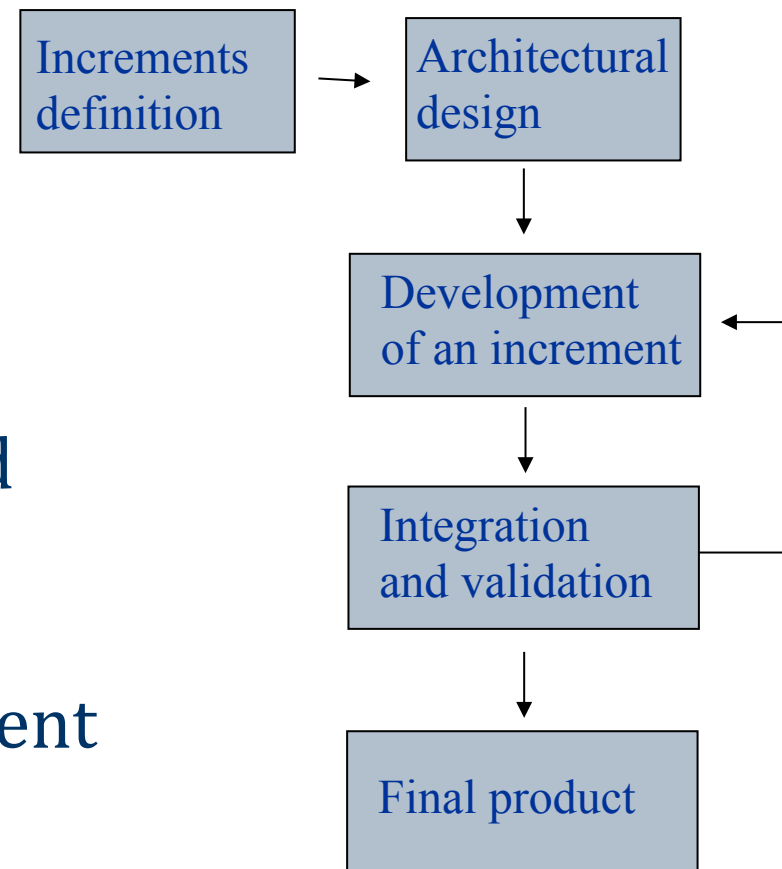

- ❑ Changes cannot be avoided
  - ❑ Technical and market environments change
  - ❑ Clients needs and wishes change
  - ❑ Management priorities change
    - ❑ Waterfall models are ineffective
- ❑ We cannot wait for stability to start
  - ❑ Time-to-market tyranny
  - ❑ The illusion of perfection

# Incremental models

---

- ❑ Divide the projects into increments

- ❑ An increment is a functional subpart of the final product
- ❑ Each increment adds new functions
- ❑ Each increment is tested
- ❑ Increments are defined *a priori* – requirements prioritization (by the client if possible)

# Incremental model - 1

---

- ❑ Evolving architecture
  - ❑ The first increment builds the core
  - ❑ Next increments build on top of the core
  - ❑ Each increment implements a complete lifecycle

# Incremental model - 2

---

- ❑ Stable architecture
  - ❑ The first increment defines the architecture
  - ❑ Next increments provide part of the architecture
  - ❑ Parallel development is possible

# Advantages of incremental models

---

- ❑ A first increment is rapidly delivered
  - ❑ Quick ROI
  - ❑ Management satisfaction (less stress !)
- ❑ Failure risks are decreased
  - ❑ Early detection of problems
  - ❑ Important parts are delivered at the beginning; they will be tested longer
  - ❑ Clients can add new requirements

# Limits of incremental models

---

## ❑ Increments

- ❑ Hard to define (the mapping requirements to increments is difficult)
- ❑ Too many increments → unmanageable
- ❑ Too few increments → waterfall

## ❑ Architecture

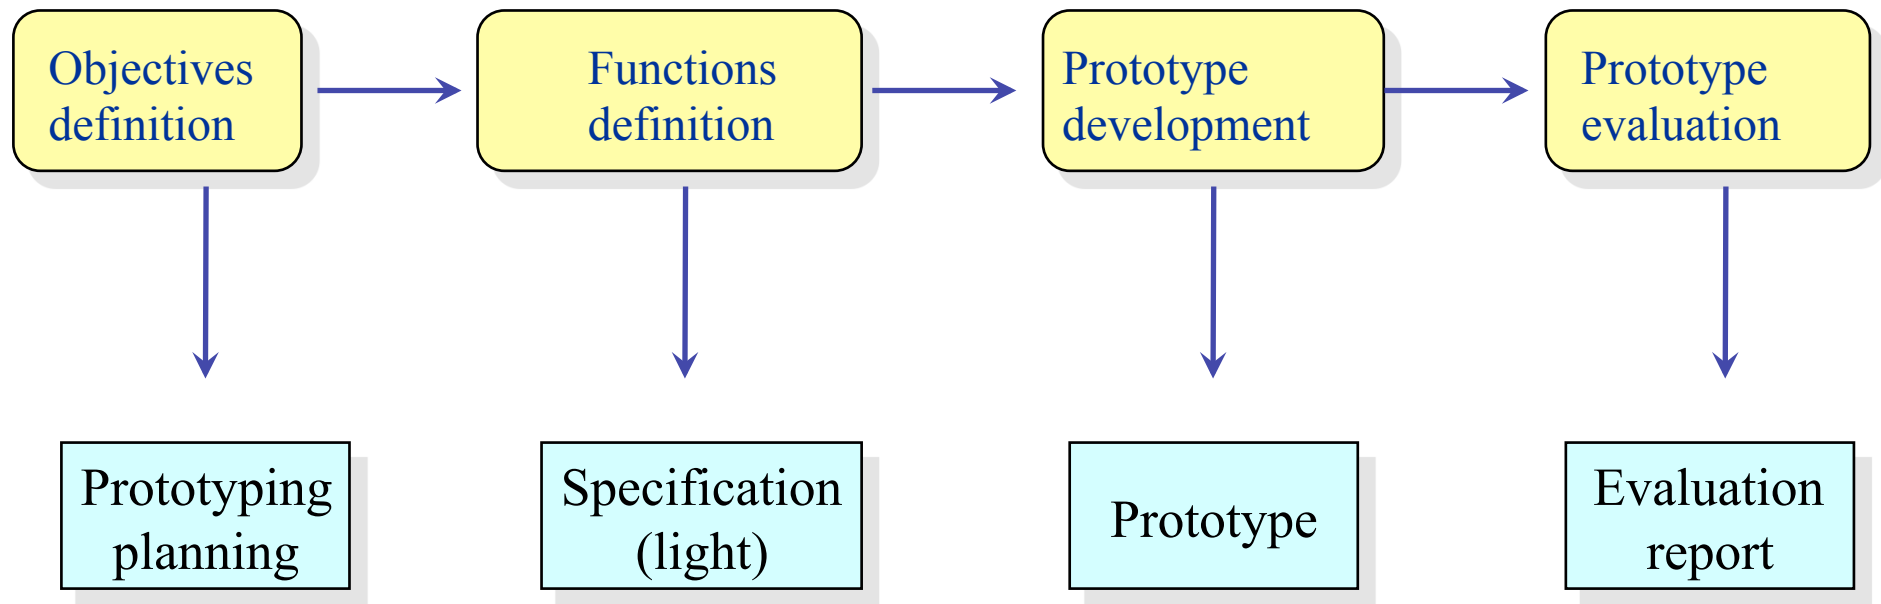

- ❑ Hard to define stable architecture at the beginning
- ❑ Hard to identify common services
- ❑ Does not deal with all possible evolutions (architectural evolutions)

# “Special” increment : prototypes

---

- ❑ Building throwaway prototypes
  - ❑ A first increment to better understand the needs and challenges (technical, ergonomics, ...)

# Advantages of prototypes

---

- ❑ User involvement
- ❑ Requirements elicitation
- ❑ Technological evaluation
- ❑ Risks mitigation
- ❑ Usable with any software process
- ❑ Available supporting tools

# Limits of prototypes

---

- ❑ Cost is badly accepted by managers
- ❑ Risk of badly focused prototype
- ❑ It is very tempting to build on top of prototype
  - ❑ Reusing non optimal design and code

# Outline

---

- ❑ Introduction
- ❑ Waterfall model
- ❑ Evolutionary development
- ❑ Agile approaches
- ❑ Conclusion

# Models presented so far

---

- ❑ A controlled approach to development
  - ❑ Precise planning
  - ❑ Quality insurance (at least management)
  - ❑ Analysis and design methods
  - ❑ Use of tools (CASE)
- ❑ Best applicability
  - ❑ Big projects (multi teams / sites / companies)
  - ❑ Long project (development and maintenance)

# But

---

- ❑ Using such processes, we may end up spending more time on the process (how a project should be conducted) than on the software building itself!

# Agile methods

---

- ❑ Characteristics
  - ❑ Development focused
  - ❑ People focused
  - ❑ Iterative
  - ❑ Quick delivering of a first executable software
- ❑ Dedicated to “rapidly evolving” domains
  - ❑ Extreme programming » (Beck)
  - ❑ Crystal » (Cockburn)
  - ❑ Adaptive software development » (Highsmith)
  - ❑ Feature driven development » (Palmer)

# Principles

---

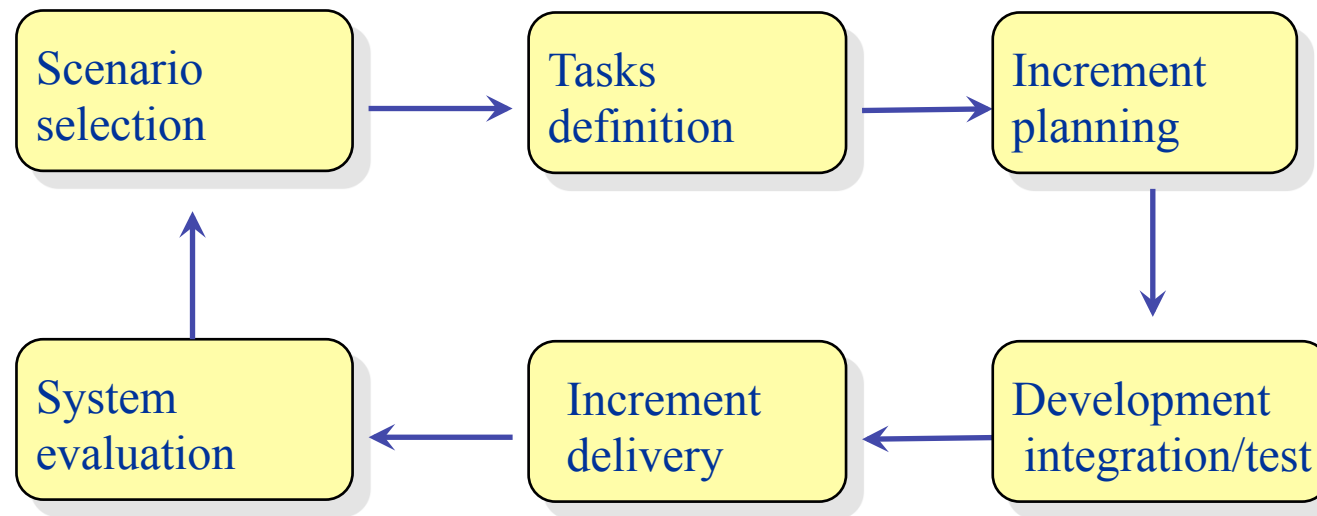

- ❑ User
  - involved in the development
  - provide requirements and priorities
  - evaluate iterations
- ❑ Increments
  - incremental delivery
- ❑ People
  - developers skill is recognized
  - no process
- ❑ Changes
  - not anticipated
- ❑ Simplicity
  - no unnecessary complexity

# Extreme programming (XP)

---

- ❑ Frequent iterations
  - ❑ Scenario selection (cards)
  - ❑ Tasks definition and distribution
  - ❑ Planning and tests
  - ❑ Increment delivery and evaluation

# XP principles

---

- ❑ Building an increment
  - ❑ Meeting every morning (standing)
  - ❑ Pair programming in a “war room”
  - ❑ War room preferably at the client site
  - ❑ Programmer defines and run tests
  - ❑ Minimal design
  - ❑ Code as simple as possible (constantly adapted)
  - ❑ Continuous integration
  - ❑ Intense rhythm

# War room

---

# Scenarios

---

**Coded scenarios**

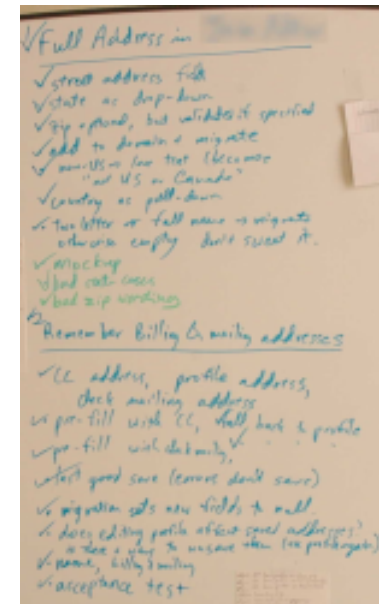

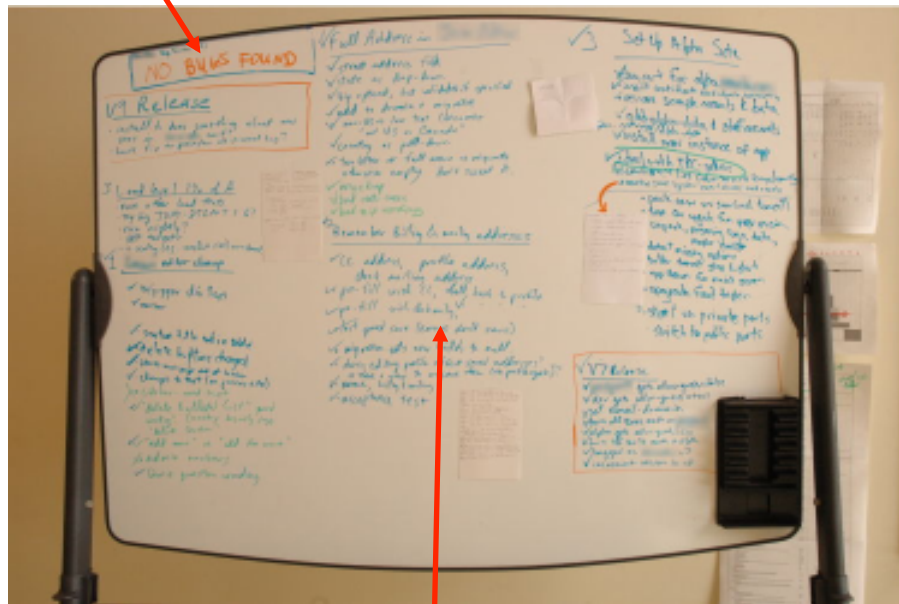

**Planned  
scenarios**

**Not planned  
Scenarios**

# Ongoing scenarios (1 to 2 weeks)

## Bug list

## Detailed scenarion

# End of iteration meeting

---

# War rooms: more examples

# Pair programming

---

- ❑ Egoless programming
  - ❑ Nobody owns the code
- ❑ Constant code review
  - ❑ Less expensive than formal reviews
- ❑ Favor code re-factoring
  - ❑ Towards simplicity
- ❑ As efficient as two independent programmers

# Verification in XP

---

- ❑ Tests is not always managed in iterative approaches
  - ❑ No complete specification before the end
- ❑ Test management in XP
  - ❑ Tests are defined first
    - ❑ Every task is tested
    - ❑ Defined with clients
  - ❑ Automatic test generation

# Issues in agile programming

---

- ❑ Client effective involvement
- ❑ Intense involvement of programmers
- ❑ Prioritization is hard (multi-clients)
- ❑ Keeping it simple requires additional work

# Outline

---

- ❑ Introduction
- ❑ Waterfall model
- ❑ Evolutionary development
- ❑ Agile approaches
- ❑ Conclusion

# Synthesis

---

- ❑ A process brings stability and control over an activity that can become chaotic
  - ❑ Better estimates
  - ❑ Better coordination
  - ❑ Better communication
  - ❑ Better productivity
  - ❑ Better visibility
- ❑ Using a process is a sign of maturity

# To remember

---

- ❑ Managers love processes
  - ❑ What a pleasure to tell clients “phase x is over”
  - ❑ Some processes are required by clients
- ❑ Developers do not like them so much
  - ❑ There is gap with what happens in the trenches
  - ❑ Never deal completely with projects dynamicity
  - ❑ Phases always overlap (processes are theory !)

# Which one is the best ?

---

- ❑ No ideal model
  - ❑ Waterfall: bad for innovative or changing projects
  - ❑ Incremental: costly for well defined, stable projects
- ❑ Small to medium projects (500 000 loc)
  - ❑ Incremental approaches are often appropriate
- ❑ Big projects
  - ❑ Mixed approaches using incremental and waterfall elements
  - ❑ Development of a prototype to identify requirements followed by a V cycle

# Conclusion

---

Without a clear plan on how to do a project, there is little chance you get anywhere !

I've got it, too, Omar... a strange feeling like we've just been going in circles
